**Assure the Health and Well being of Cast and Crew by
Ensuring a Sanitary and Sterile Environment**

Sanitation and Sterilization Services

During this NEW era of the COVID 19 pandemic, it is imperative that sets be kept free of germs, bacteria and viruses that may be transferred by touch or short radius air borne transmission. Air borne pathogens may land on equipment, tools, props, etc. On Set Sanitation offers sanitation and sterilization services through the pre-production, production and post-production phases to ensure maximum protection of cast and crew from pathogens transmitted from surfaces, and short radius air borne transmission. The Impact of Sanitation

It is clear that issues surrounding an effective sanitation program can be cumbersome and time consuming. Moreover, if not handled properly, they can lead to regulatory action against a company. That is undesirable at best. And, the importance of sanitation goes beyond regulatory action. An effective program also impacts a number of health conditions including allergens and microbiological organisms. The focus of any sanitation program is to remove or destroy the microbiological organism and remove any organic material from those areas that may support the survival or growth of the organism.

On Set Sanitation uses products and methodologies recognized by the CDC, EPA and NSF as being 99% effective in killing germs, bacteria and viruses. Available processes and methodologies includes:

- An application of disinfectant solution using an electrostatic sprayer
- Handheld UV wand that disinfects surfaces with powerful UV light.
- Antibacterial wipe downs of surfaces and equipment
- Aerosol treatment of sets
- Safe treatment application to sensitive electronic equipment (as identified)
- Waste removal
- Hand sanitizing stations
- Face masks distribution (optional)

Viruses are of particular concern. They spread from person to person, mainly in droplets that fly out when individuals cough or sneeze. These tiny drops from a sick person move through the air and land on the mouths or noses of others nearby. Germs are also passed along when you touch mucus droplets from someone else on a surface like a desk or table and then touch your own eyes, mouth or nose.

The services of On Set Sanitation have a growing appeal to advertising agencies, production companies, event planners and churches alike. We customize our services to fit most any production need or budget.
